

Event Attendance Report

OSC Committee Member: Jordan Hill

Event: Game Developers Conference (GDC)

Location: San Francisco, California

Dates: March 8–13, 2026

Date Submitted: March 17, 2026

1. Objective of Attendance

The purpose of attending GDC was to represent the Open Source Committee (OSC), engage with developers and adjacent ecosystem participants, identify opportunities to connect the Paid Open Source Model (POSM) to broader builder communities, and gather insight on open source adoption.

2. Evidence of Participation / Communications

Supporting evidence of attendance and participation includes:

- GDC registration confirmation and conference badge
- Attendance at various networking events throughout the week
- Follow-up networking contacts from discussions held during the event
- LinkedIn post documenting attendance and related discussions:
https://www.linkedin.com/posts/jordan-hill-64024772_gdc2026-opensource-godotengine-share-7439737175799402496-oNLJ?utm_source=share&utm_medium=member_desktop&rcm=ACoAAA9XbtABaR5-YFAH3cagyZnizveNDYdGx7s

3. Key Activities and Contributions

During GDC, I participated in discussions with developers, technical stakeholders, and ecosystem participants on topics related to open source sustainability, platform trust, and long-term infrastructure resilience.

A key activity was attending a Sui ecosystem networking event, where I made contacts relevant to future POSM outreach and broader cross-ecosystem relationship building. These conversations helped position POSM as a practical model for sustaining public infrastructure and contributor ecosystems.

I also engaged in discussions around the continued fallout from Unity's past platform decisions and the increasing interest in open source alternatives such as Godot. These conversations were directly relevant to OSC because they demonstrated how governance, predictability, and aligned incentives influence real developer adoption decisions.

In addition, I spoke at an open mic event during GDC, which provided an opportunity to engage with younger developers and emerging builders in a more direct and accessible setting. This was valuable for broadening awareness of open source sustainability concepts with an audience that may become future contributors, advocates, or participants in open ecosystems through Intersect.

4. Ecosystem and Committee Benefits

Attendance provided value to the Open Source Committee in several ways:

- Increased Intersect OSC visibility in an industry setting relevant to open tooling and sustainable software ecosystems
- Established new contacts through the Sui and other blockchain networking events for future engagement
- Validated that developers are increasingly concerned with governance and platform trust, not only technical features
- Helped test the relevance of POSM messaging in an external industry context
- Expanded outreach to younger developers through participation in an open mic event

5. Key Insights

- Developers are paying closer attention to governance quality and long-term platform trust.
- Godot is increasingly viewed as a credible open source alternative following Unity's loss of trust with many developers which is relevant for Cardano based game developers.
- POSM has broader relevance when framed as a practical way to sustain shared technical infrastructure for new builders in Cardano Space.
- In-person engagement remains valuable for testing messaging and building relationships across adjacent ecosystems.

6. Follow-Up Actions

- Maintain contact with relevant individuals met through the Sui networking event
- Continue refining OSC and POSM messaging around practical concerns such as sustainability, trust, and governance alignment
- Explore whether game development and open engine communities are worthwhile targets for future OSC outreach
- Build on engagement with younger developers by identifying future community-facing opportunities where OSC messaging can be introduced accessibly

7. Conclusion

Attending GDC provided meaningful value to the Open Source Committee through ecosystem representation, external relationship building, and direct engagement with developers on issues

closely related to open source sustainability. Through conversations at the Sui and other blockchain networking events, discussions around moving to open source options like Godot, and participation in an open mic event, I was able to help connect current developer concerns to the committee's broader mission of supporting sustainable public infrastructure and healthy open source ecosystems.
